## DETAILED ACTION

### *Drawings*

1. The drawings were received on 9/26/05. These drawings are accepted.

### *Allowable Subject Matter*

2. Claims 1-12 are allowed.
3. The following is an examiner's statement of reasons for allowance:

Re claim 1, the independent claim includes "a second cylinder which is included in a movably, arranged yoke, wherein the yoke is connected to the frame via a force measuring sensor which converts the force that the yoke and the frame exert upon each other into a corresponding measuring signal; characterized in that the yoke is connected with the frame via a connecting element pivotable about at least two mutually non-parallel axes about a center and that the force measuring sensor at is formed by a force sensor which is connected with the connecting element. " in combination with the remaining claim limitation is not taught and/or made obvious by the prior art. **See remarks pages-1-5, received on 8/27/08.** As depicted in fig. 1, Dillion et al. (3,559,475), considered closest to related art, teaches a first cylinder (e.g., support roller 5) included in a frame (e.g., combination of bosses (2) and base plate (1)), which is connected with a driver. Dillion et al. teaches a second cylinder (e.g., sensing roller 10) included in a movable arranged yoke (e.g., beam (8) that rotates by bearing (7)). Dillion et al. teaches the yoke (e.g. beam 8) is connected to the frame (2, 1) by connection element (e.g., combination of upstanding boss (6), bearing (7) and stub shaft (9)). As depicted in fig. 1, Dillion et al. teaches a **linear variable differential transformer (19) which includes a transformer coil (20) and a**

**armature, which is equivalent to a force measurement sensor (Col. 2, lines 52-55). Dillion et al. teaches the transformer measures the adhesive forces existing between the sensing roller (5) and the plate (P) cause a frictional drag movement of the plate (P) (Col. 1, lines 14-28). Dillion et al. does not teach a second cylinder which is included in a movably, arranged yoke, wherein the yoke is connected to the frame via a force measuring sensor which converts the force that the yoke and the frame exert upon each other into a corresponding measuring signal; characterized in that the yoke is connected with the frame via a connecting element pivotable about at least two mutually non-parallel axes about a center and that the force measuring sensor at is formed by a force sensor which is connected with the connecting element.**

4. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
